whoami

I'm Arda, a Computer Science student at TUM and a student assistant at the Institute of Automation and Information Systems in Munich.

I build AI-assisted workflows, full-stack applications, and visual tools for data processing. I am also interested in parallel programming and high-performance computing.

What to look for: practical products, user control, reliable software, and clear interfaces.

ls ~/projects.md

larpyourresume

Resume editing and PDF generation

I built a resume workspace with form and LaTeX editing, customizable layouts, autosave, and PDF export. I also developed Sisyphus, its AI assistant for tailoring resume content.

Focus: Full-stack product development and interface design.

larpyourresume.com

Werkio

AI-assisted job application workflows

I built a job platform and browser extension that use Gemini to map profile data to application forms and draft cover letters. Users review proposed changes and submit applications themselves.

Focus: User control, validation, and end-to-end testing.

CHECK24 MCP App

One endpoint for four mocked product services

I built a TypeScript proxy that connects ChatGPT to hotel, flight, package-holiday, and insurance tools. It validates requests, withholds invalid tools, and shows errors and call traces in a dashboard.

Focus: API integration and clear error handling. All product data is mocked.

Industrial data pipeline at TUM AIS

Visual workflows for industrial time-series processing

As a student assistant, I develop a Python desktop application for building and running data-processing workflows. It connects a visual editor to CSV import, signal processing, and HDF5 data storage.

Focus: Making processing steps visible and configurable.

Header

Frontend overhaul for the startup joinheader

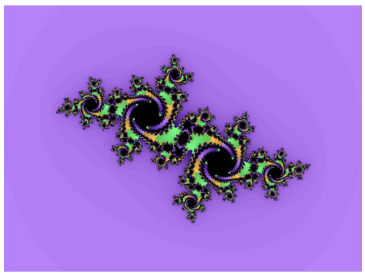

I redesigned the frontend for joinheader, an agentic coding startup.

Focus: Frontend development and visual design.
Project and preview link (preview requires access)

Julia Set Explorer

Interactive fractals built with C and WebAssembly

In this team project, I focused on SIMD profiling, correctness fixes, and performance experiments. The interactive version is available on my website.

Focus: performance optimization backed by correctness checks.
